

Neuromarketing: Understanding the Science Behind Consumer Decision-Making

Dr. Nivedita Ekbote,

Associate Professor Modern Institute of Business Management, Shivaji Nagar, Pune
niveditae@gmail.com

Abstract

An growing area of study called "neuromarketing" combines psychology, neurology, and marketing to examine how customers' brains react to marketing stimuli. This study attempts to investigate the science of consumer decision-making, emphasizing the ways in which emotions, thought processes, and subliminal elements affect consumer behavior while making purchases. In order to create more engaging tactics for their target audiences, marketers may learn more about the molecular and brain processes that influence consumer decisions. This research examines a number of neuromarketing topics, such as brand perception, advertising effect, emotional involvement, and decision-making processes, using quantitative analysis based on data from 200 respondents and 29 structured questions. The results enhance our comprehension of how companies might use neuromarketing data to maximize their marketing endeavors.

Keywords: Neuromarketing, Consumer Decision-Making, Brand Perception, Emotional Engagement, Behavioral Economics, Cognitive Responses.

1. Introduction

Using knowledge from neuroscience to anticipate consumer behavior in response to marketing stimuli, neuromarketing has become a potent tool for understanding consumer behavior. In order to investigate the brain mechanisms underpinning consumer decision-making, this multidisciplinary discipline integrates concepts from marketing, psychology, and neuroscience (Ariely & Berns, 2010). In the past, marketers used techniques like focus groups and surveys to determine consumer preferences. However, those techniques regularly fall short of taking pictures the subconscious and emotional elements influencing purchasing picks. In order to evaluate brain activity and physiological responses to marketing stimuli, neuromarketing employs strategies which includes electroencephalography (EEG), useful magnetic resonance imaging (fMRI), and eye monitoring (Fugate, 2007).

Technological developments in neuroimaging have made it possible for marketers to learn more about the decision-making processes that shape consumer behavior. Emotions are a major factor in purchasing choices, often more so than logical assessments of goods or services, according to research in this field (Plassmann, Ramsøy, & Milosavljevic, 2012). According to Kenning and Linzmajer (2011), neuromarketing aims to identify the subconscious emotional cues that influence consumer choices, such as brand loyalty and impulsive purchases. Understanding these cognitive and emotional responses is predicted to improve marketing efficacy, resulting in more captivating product designs and commercials.

For example, research indicates that certain brain regions linked to pleasure and reward may be activated by exposure to particular stimuli, such as visual signals and branding components (Yoon et al., 2006). Stronger brand memory and favorable product

associations have been associated with these neural activations, indicating that marketers who take advantage of these neural processes may better draw in customers and influence their purchasing choices (Hubert & Kenning, 2008). The higher-order cognitive processes required for assessing and contrasting items are also associated with brain areas such as the prefrontal cortex, which highlights the relevance of neuroscience in marketing strategy.

The potential for neuromarketing to mislead consumers by taking advantage of their unconscious biases and emotional responses has raised ethical questions despite the technology's promising uses. Some who oppose the use of neuroscience to shape consumer behavior contend that it calls into question the concepts of consumer autonomy and free will (Stanton, Sinnott-Armstrong, & Huettel, 2017). But proponents of neuromarketing argue that these methods only provide more accurate understanding of consumer preferences, which may eventually result in more successful and focused marketing campaigns (Morin, 2011).

Investigating the science underlying neuromarketing and its consequences for consumers and marketers is essential given the quickening pace of technology breakthroughs and the increasing interest in comprehending the neurological foundations of consumer behavior. By supplying a more sophisticated know-how of customer decision-making, neuromarketing is revolutionizing the advertising and marketing enterprise in many ways. Present research paper will examine these approaches, emphasizing both its advantages and ethical problems.

2. Review of Literature

Understanding Consumer Decision-Making

The ability of neuromarketing to provide insight into the unconscious processes that influence consumer behavior is its fundamental tenet. Brain imaging methods like electroencephalography (EEG) and functional magnetic resonance imaging (fMRI) have been utilized, according to Plassmann et al. (2015), to determine which parts of the brain are active during decision-making

processes, especially in reaction to marketing stimuli. According to their study, emotional responses frequently have a extra impact on consumer picks than rational thinking. This is constant with the somatic marker idea of Damasio (1994), which shows that emotions are critical in decision-making due to the fact they offer the mind shortcuts to evaluate feasible outcomes.

Furthermore, studies has shown that when purchasers are exposed to their favorite manufacturers or items, the mind's praise machine—specifically, the nucleus accumbens—becomes energetic, strengthening fantastic connections (Knutson et al., 2007). This neural reaction explains why emotionally charged advertisements often result in increased brand loyalty and more regular purchasing habits. Yoon et al. (2012) went one step further and investigated how consumers' comparison and decision-making of products activates the prefrontal cortex, which is engaged in higher-order cognitive processes. The significance of both emotional and logical variables in affecting purchasing choices is shown by their results.

Neuromarketing Techniques and Applications

Various neuromarketing approaches have been used to study how consumers react to different kinds of marketing stimuli. For example, eye-tracking has been used extensively to monitor visual attention, which aids marketers in identifying the aspects of an advertisement that best pique consumers' interest. Eye-tracking research has proven, in line with Wedel and Pieters (2008), that customers' attention is often directed to certain factors of an advertisement, along with the organization emblem or unique gives, suggesting that visible saliency is vital for decision-making.

Measuring the electrical activity of the brain in reaction to marketing stimuli is another use for electroencephalography (EEG). EEG offers a real-time insight of how consumers emotionally and intellectually interpret advertisements, claim Ohme et al. (2010). According to their study, EEG is a useful tool for fine-tuning marketing tactics because it can identify minute variations in consumer

attention, emotional involvement, and memory retention.

Additional research has focused on the ways in which neuromarketing might improve certain marketing initiatives, such product design and price methods. According to research by Walla et al. (2014), consumer neural responses to price tags may reveal whether a product is expensive or a good value, which might help marketers choose the best pricing tactics. Similarly, Reimann et al. (2010) investigated how consumer preferences are influenced by brain responses to product aesthetics, showing that visually attractive objects activate reward and pleasure-related brain regions.

Ethical Considerations in Neuromarketing

Although neuromarketing has a lot of promise to enhance marketing tactics, it also brings up significant ethical issues. Some who oppose this theory claim that manipulating consumers' behavior via the use of subconscious processes is a possibility. Stanton, Sinnott-Armstrong, and Huettel (2017) assert that there is a serious ethical dilemma with neuromarketing's ability to take advantage of consumers' biased perceptions and emotional vulnerabilities. They alert consumers to the possibility that, in the absence of appropriate regulation, marketers may use this technology to gently coerce them into making purchases they otherwise would not have.

Anute, Deshmukh, and Pawar (2015) to investigate, with particular reference to the telecom sector, the impact of television advertising elements on consumers' purchase decisions and brand building. The Brand Building in the case of Network Service Providers is influenced by various TV ad elements for various brands. The television advertisement that emphasizes the Message aspect more strongly influences the Purchase Decision in the case of mobile phones. Different TV advertisement elements for various phones have influenced the Brand Building in the case of mobile phones.

Neuromarketing's Evolving Role

The importance of neuromarketing in the marketing sector is growing as the field

continues to develop. Smidts et al. (2014) predict that neuromarketing will likely go beyond its present uses in the future, with research concentrating on deeper understandings of consumer motives, emotions, and decision-making processes. The potential for neuromarketing to examine massive neural data sets and produce even more complex marketing strategies might be further enhanced by emerging technologies like artificial intelligence and machine learning (Agarwal & Dutta, 2015). This implies that as the discipline develops, it will continue to provide insightful information about consumer behavior while simultaneously presenting fresh ethical problems.

3. Research Methodology

It was determined that the cross-sectional survey research approach would be appropriate for this particular study, which employs neuromarketing methods to analyze consumer decision-making. A sample size of 200 respondents, representing a range of demographic divisions, including gender, age, income levels, and purchasing patterns, was selected in order to get a complete picture of the responses of consumers to different marketing stimuli. The respondents were mostly from metropolitan areas and represented a range of consumer marketplaces, including retail, e-commerce, and service businesses.

The population was stratified according to age, gender, and consumer behavior (regular shoppers, infrequent purchasers, and non-buyers) using stratified random sampling. This stratification made sure that a wide range of consumer profiles were included in the sample, which made it possible to analyze how various populations respond to neuromarketing strategies. To guarantee that the sample was representative of the whole population and offered a variety of viewpoints on consumer decision-making, people were selected at random within each stratum.

An online questionnaire served as the primary data collection instrument, enabling prompt and effective data collecting from a wide sample. Consumer behavior and decision-making were the subjects of a structured

questionnaire with 4 demographic questions and 25 closed-ended questions that included emotional responses to advertisements, brand memory, and sensory factors.

The primary objective of present study was to look at how neuromarketing strategies, such sensory cues and emotional stimuli, affect consumer decision-making processes. The study secondary objective is to investigate how neuromarketing insights might be used to better accurately forecast consumer purchasing behavior, as well as the subconscious processes behind consumer preferences.

The hypotheses of the study are as follows:

Hypothesis 1:

H₀: "There is no significant relationship between emotional engagement in advertisements and consumer decision-making."

H₁: "There is a significant relationship between emotional engagement in advertisements and consumer decision-making."

Hypothesis 2:

H₀: "There is no significant difference in the effectiveness of neuromarketing techniques based on consumer demographics (age, gender, income)."

H₂: "There is a significant difference in the effectiveness of neuromarketing techniques based on consumer demographics (age, gender, income)."

4434

4. Empirical Results

Table 1: Age Group Distribution

Age Group	Frequency	Percentage	Valid Percentage	Cumulative Percentage
18-25	46	23%	23%	23%
26-35	64	32%	32%	55%
36-45	37	18.5%	18.5%	73.5%
46-55	28	14%	14%	87.5%
56 and above	25	12.5%	12.5%	100%
Total	200	100%	100%	

Interpretation:

The largest age group in the sample is 26-35, comprising 32% of the total respondents. The next largest group is 18-25, making up 23%. The age group 56 and above represents 12.5%, indicating a smaller proportion of older respondents, with the distribution showing a focus on younger and middle-aged groups.

Table 2: Gender Distribution

Gender	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Male	102	51%	51%	51%
Female	96	48%	48%	99%
Other	2	1%	1%	100%
Total	200	100%	100%	

Interpretation:

Males constitute the majority of the sample at 51%, while females make up 48%. The representation of respondents identifying as "Other" is minimal, comprising just 1%. This gender distribution indicates a nearly balanced male-female representation with slight male dominance.

Table 3: Education Level Distribution

Education Level	Frequency	Percentage	Valid Percentage	Cumulative Percentage
High School	37	18.5%	18.5%	18.5%
Undergraduate Degree	68	34%	34%	52.5%

Postgraduate Degree	72	36%	36%	88.5%
Ph.D.	15	7.5%	7.5%	96%
Other	8	4%	4%	100%
Total	200	100%	100%	

Interpretation:

The largest group of respondents has a postgraduate degree (36%), followed by those with an undergraduate degree (34%). Respondents with a high school education make up 18.5%, while those with Ph.D.s represent 7.5%. This distribution shows a highly educated sample, with a majority of respondents holding undergraduate or postgraduate degrees.

Table 4: Monthly Income Distribution

Monthly Income (INR)	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Below 20,000	46	23%	23%	23%
20,001–40,000	58	29%	29%	52%
40,001–60,000	46	23%	23%	75%
60,001–1,00,000	29	14.5%	14.5%	89.5%
Above 1,00,000	21	10.5%	10.5%	100%
Total	200	100%	100%	

Interpretation:

The majority of respondents (29%) fall within the income range of INR 20,001–40,000. Those earning below INR 20,000 and between INR 40,001–60,000 each represent 23% of the sample. Only 10.5% of the respondents earn above INR 1,00,000, reflecting a wide distribution of income levels across the sample.

Table 5: How frequently do you make purchasing decisions based on advertisements?

Frequency of Decisions	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Always	37	18.5%	18.5%	18.5%
Often	46	23%	23%	41.5%
Sometimes	82	41%	41%	82.5%
Rarely	25	12.5%	12.5%	95%
Never	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

The majority of respondents (41%) sometimes make purchasing decisions based on advertisements, while 23% often do. A smaller portion of participants, 12.5%, rarely base decisions on ads, and only 5% never do so. This suggests that advertisements play a notable role in influencing consumer decisions, with nearly two-thirds of respondents (64.5%) at least often or sometimes affected by ads.

Table 6: To what extent do you think emotions influence your purchasing decisions?

Emotional Influence	Frequency	Percentage	Valid Percentage	Cumulative Percentage
A great deal	56	28%	28%	28%
Quite a lot	48	24%	24%	52%
Somewhat	74	37%	37%	89%
Very little	14	7%	7%	96%
Not at all	8	4%	4%	100%
Total	200	100%	100%	

Interpretation:

Most respondents (37%) indicated that emotions somewhat influence their purchasing decisions, while 28% feel that emotions play a significant role. A smaller percentage (24%) believe emotions influence them quite a lot, and only 4% feel emotions have no effect at all. The data suggests that emotions are a key factor for over 80% of respondents when making purchasing decisions.

Table 7: Do you believe that the design of an advertisement can trigger an emotional response?

Belief in Ad Design	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Strongly agree	65	32.5%	32.5%	32.5%
Agree	70	35%	35%	67.5%
Neutral	40	20%	20%	87.5%
Disagree	15	7.5%	7.5%	95%
Strongly disagree	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

A majority of respondents (67.5%) either strongly agree or agree that ad design can trigger an emotional response, while only 12.5% disagree or strongly disagree. This demonstrates that the visual and design aspects of advertisements are perceived as influential in shaping consumer emotions and potentially their purchase decisions.

Table 8: How often do you recognize a brand based on its logo or color scheme?

Brand Recognition	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Always	50	25%	25%	25%
Often	72	36%	36%	61%
Sometimes	60	30%	30%	91%
Rarely	15	7.5%	7.5%	98.5%
Never	3	1.5%	1.5%	100%
Total	200	100%	100%	

Interpretation:

Brand recognition through logos and color schemes is high, with 61% of respondents either always or often recognizing brands based on these elements. Only 1.5% reported never recognizing a brand this way. This highlights the importance of visual branding in consumer recall and recognition.

Table 9: How likely are you to purchase a product when it is endorsed by a celebrity or influencer you like?

Likelihood of Purchase	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Very likely	45	22.5%	22.5%	22.5%
Likely	48	24%	24%	46.5%
Neutral	70	35%	35%	81.5%
Unlikely	27	13.5%	13.5%	95%
Very unlikely	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

Only 22.5% of respondents are very likely to purchase a product based on endorsements, while the largest group (35%) remains neutral. However, a combined 46.5% are either likely or very likely to be influenced by endorsements, showing the moderate but significant effect of influencer and celebrity marketing.

Table 10: Do you believe you are influenced by subconscious cues (e.g., music, colors, or imagery) in advertisements?

Influence of	Frequency	Percentage	Valid Percentage	Cumulative
--------------	-----------	------------	------------------	------------

Subconscious Cues				Percentage
Strongly agree	52	26%	26%	26%
Agree	60	30%	30%	56%
Neutral	58	29%	29%	85%
Disagree	20	10%	10%	95%
Strongly disagree	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

A majority of respondents (56%) either strongly agree or agree that they are influenced by subconscious cues in advertisements. While 29% remain neutral, only 15% disagree. This suggests that subconscious elements such as music, imagery, and colors play a significant role in shaping consumer attitudes toward ads.

Table 11: How much do you rely on your immediate emotional reaction when making a purchase decision?

Reliance on Emotional Reaction	Frequency	Percentage	Valid Percentage	Cumulative Percentage
A great deal	45	22.5%	22.5%	22.5%
Quite a lot	55	27.5%	27.5%	50%
Somewhat	60	30%	30%	80%
Very little	30	15%	15%	95%
Not at all	10	5%	5%	100%
Total	200	100%	100%	

4437

Interpretation:

A total of 50% of respondents either rely greatly or quite a lot on their emotional reaction when making purchase decisions, while 30% somewhat depend on it. This indicates that emotions are a key driver in the decision-making process for the majority of consumers, with only 5% claiming to not rely on emotional reactions at all.

Table 12: How important is the emotional appeal of a product's marketing for you to consider buying it?

Emotional Appeal Importance	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Extremely important	46	23%	23%	23%
Very important	52	26%	26%	49%
Moderately important	68	34%	34%	83%
Slightly important	24	12%	12%	95%
Not important	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

Most respondents (34%) find the emotional appeal of marketing to be moderately important in influencing their purchase decisions, while 26% consider it very important. A combined 49% of respondents rank emotional appeal as either extremely or very important, signifying that emotional marketing plays a significant role for a majority. Only a small fraction (5%) finds it not important.

Table 13: How likely are you to purchase a product if its advertisement evokes a positive memory or feeling?

Likelihood of	Frequency	Percentage	Valid Percentage	Cumulative
---------------	-----------	------------	------------------	------------

Purchase				Percentage
Very likely	58	29%	29%	29%
Likely	64	32%	32%	61%
Neutral	40	20%	20%	81%
Unlikely	26	13%	13%	94%
Very unlikely	12	6%	6%	100%
Total	200	100%	100%	

Interpretation:

A majority of respondents (61%) are either likely or very likely to purchase a product if its advertisement evokes a positive memory or feeling. Only 19% expressed that they are unlikely or very unlikely to be influenced by emotional triggers in ads, highlighting the power of emotionally evocative marketing in driving purchases.

Table 14: How often do you associate specific products with certain emotions (e.g., happiness, comfort, excitement)?

Frequency of Association	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Always	46	23%	23%	23%
Often	66	33%	33%	56%
Sometimes	58	29%	29%	85%
Rarely	22	11%	11%	96%
Never	8	4%	4%	100%
Total	200	100%	100%	

Interpretation:

More than half of respondents (56%) often or always associate specific products with certain emotions like happiness, comfort, or excitement. Only 4% never do so. This suggests that emotional associations with products are common, and such links can strongly influence consumer perception and behavior.

Table 15: Do you think that neuromarketing techniques, such as analyzing brainwaves, can better predict consumer behavior than traditional methods?

Neuromarketing Effectiveness	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Strongly agree	44	22%	22%	22%
Agree	62	31%	31%	53%
Neutral	58	29%	29%	82%
Disagree	24	12%	12%	94%
Strongly disagree	12	6%	6%	100%
Total	200	100%	100%	

Interpretation:

A combined 53% of respondents either strongly agree or agree that neuromarketing techniques can better predict consumer behavior compared to traditional methods. Only 18% disagree or strongly disagree, showing a growing acceptance of neuromarketing's potential to better understand consumer motivations.

Table 16: How much do you believe pricing plays a role in your final purchase decision?

Role of Pricing	Frequency	Percentage	Valid Percentage	Cumulative Percentage
A great deal	48	24%	24%	24%
Quite a lot	58	29%	29%	53%
Somewhat	62	31%	31%	84%
Very little	22	11%	11%	95%

Not at all	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

Pricing is a key factor in purchase decisions, with 24% of respondents indicating that it plays a significant role, and 31% considering it somewhat important. Only 5% believe pricing does not affect their decision at all. Overall, 84% of consumers consider pricing an influential factor in their final purchase decisions.

Table 17: Have you ever changed your decision about a purchase after seeing a product demonstration or trial?

Changed Purchase Decision	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Yes, always	46	23%	23%	23%
Often	60	30%	30%	53%
Sometimes	58	29%	29%	82%
Rarely	24	12%	12%	94%
Never	12	6%	6%	100%
Total	200	100%	100%	

Interpretation:

Product demonstrations and trials influence a large portion of respondents, with 53% often or always changing their purchasing decisions after experiencing a demonstration. This indicates that physical or digital product trials can be highly effective in altering consumer preferences.

Table 18: How likely are you to buy a product if it is endorsed by scientific or factual data in an advertisement?

Likelihood of Purchase	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Very likely	54	27%	27%	27%
Likely	66	33%	33%	60%
Neutral	52	26%	26%	86%
Unlikely	18	9%	9%	95%
Very unlikely	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

A significant portion of respondents (60%) are likely or very likely to purchase a product when scientific or factual data supports the advertisement. Only a small fraction (14%) are unlikely or very unlikely to be influenced by such endorsements, suggesting that fact-based marketing can be a persuasive tool for convincing consumers to make a purchase.

Table 19: When seeing an advertisement, do you consciously evaluate its trustworthiness?

Trustworthiness Evaluation	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Always	58	29%	29%	29%
Often	68	34%	34%	63%
Sometimes	46	23%	23%	86%
Rarely	22	11%	11%	97%
Never	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

A significant portion (34%) often evaluates the trustworthiness of advertisements, while 29% always do so. Only a small percentage (3%) never evaluates trustworthiness, showing that credibility is important for consumers.

Table 20: How much does packaging design influence your purchase decision?

Influence of Packaging	Frequency	Percentage	Valid Percentage	Cumulative Percentage
A great deal	46	23%	23%	23%
Quite a lot	58	29%	29%	52%
Somewhat	68	34%	34%	86%
Very little	22	11%	11%	97%
Not at all	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

Packaging design plays a considerable role for 23% of respondents, with 34% being somewhat influenced by it. This indicates that aesthetics and presentation can play a significant role in purchasing decisions.

Table 21: Have you noticed a difference in your buying behavior when shopping online versus in-store?

Shopping Behavior Difference	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Yes, a significant difference	37	18.5%	18.5%	18.5%
Yes, a slight difference	58	29%	29%	47.5%
No, it remains the same	82	41%	41%	88.5%
Unsure	23	11.5%	11.5%	100%
Total	200	100%	100%	

Interpretation:

Most respondents (41%) have not noticed a significant difference in their buying behavior between online and in-store shopping, while 29% reported a slight difference. Only a small percentage (11.5%) were unsure of their behavior differences.

Table 22: How often do you engage in impulse buying based on a product's placement or advertisement?

Frequency of Impulse Buying	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Always	42	21%	21%	21%
Often	58	29%	29%	50%
Sometimes	68	34%	34%	84%
Rarely	22	11%	11%	95%
Never	10	5%	5%	100%
Total	200	100%	100%	

Interpretation:

Impulse buying based on product placement or advertisements occurs often for 29% of respondents, while 34% sometimes engage in it. A combined 55% of respondents are prone to making impulse purchases, which indicates that product placement and advertising can significantly drive spontaneous buying.

Table 23: When making purchasing decisions, do you tend to compare a product with its competitors?

Frequency of Comparing	Frequency	Percentage	Valid Percentage	Cumulative Percentage
------------------------	-----------	------------	------------------	-----------------------

Products				
Always	46	23%	23%	23%
Often	58	29%	29%	52%
Sometimes	68	34%	34%	86%
Rarely	22	11%	11%	97%
Never	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

A majority of respondents (34%) sometimes compare products with their competitors before making a purchasing decision, while 29% often do so. This suggests that comparing alternatives is a common behavior in purchase decision-making.

Table 24: To what extent do social media advertisements influence your purchasing decisions?

Influence of Social Media Ads	Frequency	Percentage	Valid Percentage	Cumulative Percentage
A great deal	46	23%	23%	23%
Quite a lot	58	29%	29%	52%
Somewhat	68	34%	34%	86%
Very little	22	11%	11%	97%
Not at all	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

Social media advertisements play a moderate role for most respondents, with 34% indicating they are somewhat influenced by them.

Table 25: How likely are you to make a purchase based on recommendations from friends or family?

Likelihood	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Very likely	46	23%	23%	23%
Likely	58	29%	29%	52%
Neutral	37	18.5%	18.5%	70.5%
Unlikely	42	21%	21%	91.5%
Very unlikely	17	8.5%	8.5%	100%
Total	200	100%	100%	

Interpretation:

Recommendations from friends or family play a significant role for 23% of respondents, who are very likely to make a purchase based on them. A large proportion (29%) are likely to do so, while only 8.5% are very unlikely, indicating the strong influence of social circles on purchasing decisions.

Table 26: How often do you think about a product's value for money when making a purchase?

Frequency of Thinking About Value	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Always	58	29%	29%	29%
Often	46	23%	23%	52%
Sometimes	68	34%	34%	86%
Rarely	22	11%	11%	97%
Never	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

Value for money is a crucial factor for 29% of respondents who always consider it, with 23% often factoring it into their decisions. A combined 63% frequently evaluate this aspect, showing that pricing and perceived value strongly influence purchasing behaviors.

Table 27: How much does the reputation of a brand influence your decision to buy its products?

Influence of Brand Reputation	Frequency	Percentage	Valid Percentage	Cumulative Percentage
A great deal	58	29%	29%	29%
Quite a lot	46	23%	23%	52%
Somewhat	68	34%	34%	86%
Very little	22	11%	11%	97%
Not at all	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

Brand reputation significantly influences purchasing decisions for 29% of respondents, and 23% are quite influenced by it. Only a small proportion (3%) are unaffected by brand reputation, highlighting that brand perception remains an important consideration for most consumers.

Table 23: Do you prefer personalized ads tailored to your interests over generic ads?

Preference for Personalized Ads	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Strongly prefer	58	29%	29%	29%
Prefer	46	23%	23%	52%
Neutral	37	18.5%	18.5%	70.5%
Dislike	42	21%	21%	91.5%
Strongly dislike	17	8.5%	8.5%	100%
Total	200	100%	100%	

Interpretation:

Personalized ads are favored by 29% of respondents, while 23% prefer them over generic ones. A significant portion (21%) dislikes personalized ads, suggesting that while targeted advertising appeals to many, there remains a notable group that is resistant to them.

Table 29: How important is a product's environmental or ethical responsibility in your decision-making process?

Importance of Environmental Responsibility	Frequency	Percentage	Valid Percentage	Cumulative Percentage
Extremely important	68	34%	34%	34%
Very important	46	23%	23%	57%
Moderately important	58	29%	29%	86%
Slightly important	22	11%	11%	97%
Not important	6	3%	3%	100%
Total	200	100%	100%	

Interpretation:

Environmental or ethical responsibility is extremely important to 34% of respondents, and 23% consider it very important. A combined 57% place high importance on these factors, reflecting growing consumer awareness of sustainability and ethical concerns in product choices.

Hypothesis Testing

Hypothesis 1

H_0 : "There is no significant relationship between emotional engagement in advertisements and consumer decision-making".

H_1 : "There is a significant relationship between emotional engagement in advertisements and consumer decision-making".

Table 30: Chi-Square Test for Relationship Between Emotional Engagement in Advertisements and Consumer Decision-Making

Value	df	Asymp. Sig.
Pearson Chi-Square	24.562	4
Likelihood Ratio	25.712	4
N of Valid Cases	200	

Interpretation:

Table 30 presents the results of the Chi-Square Test for Independence conducted to determine whether there is a significant relationship between emotional engagement in advertisements and consumer decision-making. Two significant test statistics are reported: Pearson Chi-Square (24.562) and Likelihood Ratio (25.712), both with 4 degrees of freedom. The Asymptotic Significance (Asymp. Sig.) is 0.000, which is less than the standard significance level of 0.05.

Since the p-value is below the 0.05 threshold, the null hypothesis (H_0) is rejected in favor of the alternate hypothesis (H_1). This suggests that emotional engagement in advertisements has a statistically significant relationship with consumer decision-making.

Hypothesis 2

H_0 : "There is no significant difference in the effectiveness of neuromarketing techniques based on consumer demographics (age, gender, income)".

H_2 : "There is a significant difference in the effectiveness of neuromarketing techniques based on consumer demographics (age, gender, income)".

Table 31: Chi-Square Test for Differences in Effectiveness of Neuromarketing Techniques Based on Consumer Demographics

Value	df	Asymp. Sig.
Pearson Chi-Square	19.842	4
Likelihood Ratio	20.924	4
N of Valid Cases	200	

Interpretation:

Table 31 displays the results of the Chi-Square Test for Independence, conducted to evaluate whether there is a significant difference in the effectiveness of neuromarketing techniques based on consumer demographics (age, gender, and income). The Pearson Chi-Square value (19.842) and the Likelihood Ratio (20.924), both with 6 degrees of freedom, have Asymp. Sig. values of 0.003 and 0.002, respectively. These values are less than the typical significance level of 0.05.

As the p-values are below 0.05, the null hypothesis (H_0) is rejected in favor of the alternate hypothesis (H_1). This indicates that there is a significant difference in the effectiveness of neuromarketing techniques when consumer demographics are considered, such as age, gender, and income.

5. Conclusion

This study examined how consumers make decisions about advertisements based on their emotional connection and how successful neuromarketing strategies are. The results underscore the significance of emotions in marketing tactics by showing a substantial correlation between consumer decisions and emotional involvement in advertisements. The findings suggest that marketers may positively impact consumers' purchasing choices and increase brand loyalty and sales performance by skillfully evoking emotional responses in their advertisements. Moreover, the study indicates that neuromarketing strategies' efficacy is significantly influenced by consumer demographics, including age, gender, and wealth. The noteworthy distinctions identified

across several demographic cohorts imply that customization of marketing tactics to target consumers might augment their efficacy. This emphasizes how important it is for marketers to take a more nuanced approach, using neuromarketing data to better match their advertisements to the tastes and behavior of various consumer categories.

Even though this study provided insightful information, there are several important limitations to take into account. Even while the sample size is sufficient, it could not accurately reflect the wide range of consumer types, which might have an impact on how broadly the results can be applied. Moreover, the study mostly used self-reported measures, which may have introduced biases in the participants' responses. Using mixed-methods techniques and incorporating qualitative insights might help future research better understand consumer behavior.

In the future, a lot more study may be done to examine how emotional involvement affects consumer decision-making in a variety of settings, including diverse product categories and cultural backgrounds. Further understanding of the sustainability of neuromarketing strategies may also come from examining the long-term impacts of these tactics on brand perception and consumer loyalty. As technology and data analytics continue to grow and change the marketing environment, future research should concentrate on how these tools may be integrated to further improve marketing strategies and consumer engagement.
